Bypass Oxygen Analyzer Package

- Provides the same accurate, reliable measurement of excess oxygen in combustion flue gas as standard in situ, industrial oxygen analyzer
- Inconel steel tubes provide effective resistance to corrosion
- Utilizes no moving parts, air pumps or other components common to sampling systems that require frequent maintenance to remain on-line
- Simple installation provides flexibility to meet various application and space requirements
- Analyzer output ideal for input to automatic combustion trim control

Process heaters found in refineries and other chemical processing industries present high-temperature problems for in situ (located directly within the boiler flue) flue gas oxygen sensors. Emerson’s Rosemount Analytical in situ, zirconium oxide probe-type oxygen analyzer has long been established as the standard of the industry. The Bypass Package has been proven to withstand the high temperatures in process heaters while providing the same advantages offered by the in situ sensor.

The in situ, zirconium oxide oxygen flue gas sensor employs a solid electrolyte sensor inserted directly within the flue, using no moving parts or troublesome sample lines that often experience maintenance problems.

Emerson’s Rosemount Analytical oxygen analyzer is a highly reliable flue gas sensor that provides accurate measurements of excess oxygen in combustion flue gas. This measurement can then be incorporated into a combustion trim control program for improving combustion efficiency. The improved efficiency often reduces combustion fuel bills by thousands of dollars, offering returns on the investment in very short time periods.

APPLICATION

While the atmospheres within process heater flues are relatively clean because the burners are fired in most cases with natural gas or refinery fuel gas, temperatures within the stacks vary from 1200°F to 2000°F (650°C to 1050°C). Industrial oxygen analyzers typically use an in situ sensor capable of withstanding flue gas temperatures as high as 1300°F (700°C).

The Bypass Oxygen Analyzer Package was developed to meet process heater application requirements. The Bypass Package employs a standard Emerson industrial-type excess oxygen flue gas analyzer, along with two inconel steel tubes to measure excess oxygen content within the combustion flue gas of the process heater. An inconel tube directs the flue gas to the flue gas analyzer mounted outside the stack. The other inconel tube directs the flue gas back inside the stack. The oxygen analyzer then outputs a fast, highly accurate oxygen measurement ideal for use as an input to closed-loop combustion trim control.

PRINCIPLES OF OPERATION

The Bypass Package extends the inconel tubes into the flue gas stream. The 1 inch tube directs the flue gas to the oxygen sensor. The 2 inch pipe then directs the flue gas back into the flue.

The oxygen analyzer is mounted outside the stack with the external stainless steel housing. The sensor housing is insulated from the ambient temperature outside the stack at the time of installation. This feature prevents the flue gas from reaching the dew point, eliminating the threat of condensation inside the pipes.

The Bypass Package utilizes a natural ram-air effect to direct the sample gas past the oxygen sensor. Thus, no sample pumps (which require moving parts that often break down), air supplies or aspirators are needed to extract a flue gas sample. This feature eliminates the unreliability and maintenance problems inherent to sampling methods. Applications with heavy particulate loading should utilize a high temperature probe mounting jacket (see PDS 106-303.A01).
The flue gas travels through the inconel pipes by means of natural pressure differential across the inlet and discharge openings. While traveling to the oxygen sensor, the flue gas cools to a temperature suitable to the situ oxygen sensor.

**INSTALLATION DIMENSIONS**

The flue gas operating temperature range to 2000°F (1050°C).

1. Insulate to ensure flue gas temperature does not go below dew point or exceed 1050°C. Recommended two inch thick insulation. Thermal conductivity K equals 0.5 for insulation.

2. All dimensions are in inches with millimeters in parenthesis unless indicated otherwise. Dimensional drawings are subject to change without notification.
